There are two different versions of the XEP80-II AtariWriter 80 in this folder.

- **AW80XL XEP80-II.atr**: Runs on 48-64K Atari 8-Bit systems (memory upgraded 400 & 600XL, 800, 800XL, 65XE, XEGS).

- **AW80XE XEP80-II.atr**: Runs on 128K machines, utilizing the expanded memory to work on longer documents.

Both files have a custom version of the main program that has a built-in 40/80 column toggle for the XEP80-II which will switch it from the standard 40 column mode over to 80 columns upon loading.

The dictionary file that has also been provided, works with either the XE or XL version of the AtariWriter 80 program, and should be made available via disk drive #2 if you wish to do spellchecking.

For commands, consult the included Quick Reference document.
